                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tissues, preferably human, or rodent, such as mouse or rat, liver, kidney or adipose cells or tissues. It is used to treat a disease or condition associated with PTEN, such as a metabolic disease or condition, preferably diabetes, especially Type 2 diabetes, or a hyperproliferative condition. It is also used to decrease blood glucose or insulin levels in an animal, preferably a diabetic human or rodent. It is also used to decrease insulin sensitivity, in an animal, preferably a diabetic human or rodent. It is used to decrease insulin preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal, preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal, preferably a diabetic human or rodent. The diabetic human or rodent. It is also used in antisense gene thorapy. The
The present invention relates to therapeutic agents comprising a first domain (D1) that binds a protein having at least seven consecutive glutamine (Glu) residues, a second domain (D2) that binds another protein having at least 7 consecutive Glu residues, and a third domain (D3) that separates D1 from D2. The therapeutic agents of the invention are useful for inhibiting protein-protein interactions (a a according to the second consecution are useful for inhibiting protein-protein interactions (a consecution are useful for inhibiting protein-protein interactions).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polyglutamine-containing transcription factor; hexamerisation of p53 homodimerisation of jun; expanded trinucleotide repeat; CAG repeat; Huntington's disease; HD; primal and bulbar muscular atrophy; SBMA; dentatorubral-pallidoluysian atrophy; spinocerebellar ataxia type 1; spinocerebellar ataxia type 2; spinocerebellar ataxia type 6; spinocerebellar ataxia type 7; Machado-Joseph disease; MJD/SCA3;
                                                                                                                                                                                                                                                                                                                                Novel agent for inhibiting protein-protein interaction useful to treat Alzheimer's disease, has two domains which bind first, second proteins with seven consecutive glutamine residues and a domain separating two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

The therapeutic agents can also be used to treat various disorders, including those associated with expanded trinucleotide (CAG) repeats. For example such disorders can include Huntington's disease (HD), primal and bulbar muscular atrophy (SBMA), dentatorubral-pallidoluysian atrophy, spinocerebellar ataxia type 17, or Machado-Joseph disease (MJD/SCA3). The present sequence represents an oligonucleotide used to generate double strande DNA with trinucleotide extensions
                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  single nucleotide polymorphism; SNP; fish; Salmo salar; Orechromis niloticus; Atlantic halibut; microsatellite; polymorphic site; seabass; salmonidae; Tilapia; rainbow

```

single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nucleotide seminare that the life in the life in

and (ii) a nucleic acid having nucleotide sequence that hybridises to (i), or its complement under highly stringent hybridisation conditions. Also described: (1) an isolated oligonucleotide (II) comprising at least 17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites, or their complement; (2)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC sample genotype and one of the candidate parent genotype identifies to the origin of the sample. (M1) is useful for determining the origin of the sample where a match between the other origin of the sample. (M2) is useful for determining the origin of the final sample. (M3) is useful for determining the origin of the ample such as family salmonidae, S. salar, Tilapia, O. niloticus, and eterting nucleic acid molecule comprising NNP in a sample, which comparison the sample containing nucleic acids with one or more (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus (SNPs, and identifying nucleic acid that hybridises to (II). (II) is comprising contacting the sample containing nucleic acids with one or more (II) which is derived from O. niloticus (CC sequence in a sample, comprising contacting the sample containing nucleic acid swith one or more (II) which is derived from O. niloticus (CC sites or seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II). (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
```

This invention relates to a novel human Alzheimer's disease marker which consists of at least 15 contiguous bases of phosphatase and tensin (PTEN) gene homologue deleted on chromosome 10 or a p70 S6 kinase gene. The

New double-stranded oligomeric compounds that modulate PTEN expression, useful for diagnosing, preventing or treating conditions associated wit PTEN, e.g. metabolic diseases, type 2 diabetes or hyperproliferative

By making the marker into a parameter, therapeutic agents for Alzheimer's disease can be screened. The invention provides a precise diagnosis of Alzheimer's disease and thus more suitable treatment can be provided to the patient

                        AAV48709-886 represent antisense oligonucleotides directed against the ErbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in significant redcution in ErbB-2 protein expression, while oligonucleotides AAV48729-886 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive eytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating the expression of PTEN (also known as MMAC1 and TEP1). The compound is useful for inhibiting the expression of PTEN in cells or issues to treat diseases associated with their expression, e.g. metabolic diseases or conditions, type 2 diabetes or hyperproliferative conditions. In addition, the compound is used for diagnostics, or as research reagents or kits. The invention is useful in gene therapy. The present sequence is human PTEN DNA specific antisense
                                                                                                                                                                                                                                                                                                                                                        Example 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                         preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Schlingensiepen K,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   31-JAN-1997;

                                                                             The invention relates to an isolated nucleic acid (I) promoter capable or regulating transcription of an operably linked DNA sequence. The promote sequences may be used for selectively modulating expression of any operatively linked gene and provide additional regulatory element diversity in a plant expression vector in gene stacking approaches, and for regulating gene expression in male reproductive tissues or gene transcription of any target gene (e.g. for controlling ferrility, insect pathogen or herbicide tolerance). The nucleic acids are useful as hybridisation probes or primers in hybridisation assays of other plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ETB-2, junB, junD, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                 tissues to identify closely related or homologous genes and associated regulatory sequences. ABK27808-ABK27918 represent corn male reproduction tissue promoter sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                           WPI;

                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                             The invention describes a method of predicting, diagnosing or prognosing a cardiovascular disease by detection of a polynucleotide in a biological sample comprises hybridising at least one of the polynucleotide to a nucleic acid material of a biological sample, thus forming a hybridisation complex, and detecting the hybridisation complex. The polynucleotides, antidense molecule, antibody and reagent are useful for preparing compositions for preventing, predicting or diagnosing, or a medicament for treating a cardiovascular disease, e.g. arteriosclerosis, ischaemia, angina pectoris, or myocardial infarction. This sequence represents a primer used to identify genes differentially regulated in individuals with cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Predicting, diagnosing or prognosing a cardiovascular disease, angina, ischemia, myocardial infarction or arteriosclerosis by of a polynucleotide in a biological sample comprises detecting hybridization complex.

CC first active agent comprising an fligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antialtergic, antiasthmatic, hypotensive, CC use in antisense gene therapy. The composition is useful for treating or CC reventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC set fire sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO corresponding RNAs, ubiquinone. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or The invention relates to a novel pharmaceutical composition first active agent comprising an oligonucleotide antisense Disclosure; SEQ ID NO 6447; 872pp; English. composition, which has

H37989-derived oligonucleotide SEQ ID

6447

```
CC comprising oligonucleotides, effective for alleviating control or reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, control adenosine sensitivity, levels of adenosine (A) or (A) receptors, control adenosine en or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating control or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery construction or cancer and can be anti-sense to the corresponding mRNA. CC The invention has antiallergic, antiinflammatory, antiasthmatic, confict in separate containers, (b) the oligonucleotides, (c) constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, confict adding a carrier and cytostatic activity, is a composition composition composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition composition composition and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The confidence the amount of target polypeptide present in the lungs. The confidence the administratory allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, respiratory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δ
                                                   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by cC performing a single-nucleotide primer extension reaction. The CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to cc assess by association analysis the genotype of an individual or group of cindividuals, having a pathological phenotypic trait suspected of being CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, consteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune confidences, including, rheumatoid arthritis, multiple sclerosis, cancer, nervous system diseases and infection by pathogenic confidences and such sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc

RESULT 217
ABD25908
         CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
beta-adrenergic agonist. The composition is useful for preventing or
CC creating a respiratory, lung or malignant disease. The administered
CC or availability, or to increase the degradation of the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
with a disease or condition such as pulmonary vasoconstriction, pulmonary
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary

                                                                                                                                                                                                                                                                                                                         The invention relates to a novel intercalator having a specific formula. The intercalator of the invention may be useful for the electrochemical detection of a gene, as an electrochemical double stranded DNA detection reagent and as an intercalator for inhibiting the influence of mismatch DNA and single stranded DNA. The intercalator enables the transmission of electronic transition between two base pairs to occur efficiently. The current sequence is that of the electrochemical detection intercalator-related DNA 1 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     metabolic diseases or conditions, type 2 diabetes or hyperproliferative conditions. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The invention is useful in gene therapy. The present sequence is human PTEN DNA specific double stranded antisense oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises primers and probes for detecting a polymorphism in the human TFAP-2-beta gene associated with risk of developing type II diabetes. The primers and probes of the invention are useful for detecting the polymorphism in the human TFAP-2-beta gene associated with risk of developing type II diabetes. The present DNA sequence represents a probe that was used to detect the type 2 diabetes-related polymorphism in the human TFAP-2-beta gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel probe for detecting polynucleotide associated with risk of developing type II diabetes, the polynucleotide containing a substitution of guanine to thymine at position 774 of first intron of TFAP-2 beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 21 BP; 15 A; 0 C; 2 G; 3 T; 0 U; 1 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-NOV-2002; 2002JP-00338704.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate (double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                         AAQ75577
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         JP06303997-A

The method can be used to analyse gene expression rapidly and easily

                     A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

The invention is based on the discovery of the human SR-BI gene (see AAX2498-509) and on the identification of polymorphic regions within the gene which are associated with abnormal body mass index (BMI) and abnormal lipoprotein levels and hence with disorders such as obesity, cachexia, cardiovascular disorders and gallstone formation. Primers (see AAX2450-35) are provided for amplification of the exons, introns and promoter region of the SR-BI gene for detection of polymorphisms and mutations. The invention provides methods for determining whether a subject has, or is at risk of developing, a disease associated with a specific allele of a polymorphic region of an SR-BI gene. Kits comprising the relevant probe or primer are claimed. (Updated on 20-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo

The invention is based on the discovery of the genomic structure of the human SR-BI gene (see AAX24590-601) and on the identification of polymorphic regions within the gene which are associated with abnormal body mass index (BMI) and abnormal lipoprotein levels and hence with disorders such as obseity, cachexia, cardiovascular disorders and gallstone formation. Claimed primers (see AAX24602-25) are used for the amplification of the exons, introns and promoter region of the SR-BI gene for detection of polymorphisms and mutations. The invention provides methods for determining whether a subject has, or is at risk of developing, a disease associated with a specific allele of a polymorphic region of an SR-BI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acids comprising intronic sequence of a human scavenger receptor-BI (SR-B1) gene - useful for prognosis, diagnosis and treatment of SR-BI associated diseases or conditions.

The polymorphisms can be used as single nucleotide polymorphisms (SNPs) for detecting genetic linkage related to phenotypic variation in activity or expression of UGT2B protein. The polymorphism containing nucleic acid molecules may also be used for generating genetically modified non-human animals and for obtaining site specific gene modification in cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a polymorphic fragment of exon 1 of the human UDP-glucuronosyltransferase (UGT2B7) gene. UDP-glucuronosyltransferase (UGT8) are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates. The UGT2B gene subfamily encode steroid metabolizing isoforms in the liver. Alteration of the expression or function of UGTs may effect drug metabolism. The invention relates to non-chromosomal nucleic acid molecules, which comprise human UGT2B sequence polymorphisms. Probes which detect the UGT2B locus polymorphisms can be used to detect altered UGT2B metabolism of a substrate in an individual. The nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primer; lycopene beta-cyclase; gene expression; chromogenic carotogenesis; tomato mutant; tomato; tomato introgression line B1 clone; fine mapping; fruit development; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human UDP-glucuronosyltransferase sequence, polymorphisms for genotyping individuals to predict rate of metabolism of substrates and for identifying potential drug interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Forward primer for lycopene beta-cyclase B allele amplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses the use of DNA segments having lycopene cyclase catalytic activity and its control elements for controlling gene expression in chromogenic tissues of plants, especially fruits and flowers, by altering carotogenesis. They can be used as probes for isolating gene encoding polypeptides homologous to lycopene cyclase. Dominant allele of gene B from tomato mutant 'high-beta' was mapped to chromosome no.6 and was found in the tomato introgression line IL 6-2. The present sequence is a forward PCR primer used in the amplification full length cDNA of the B allele. This primer was derived from the Bl clone. This was used in fine mapping and cloning of the B locus and sequence analysis to determine the regulation of expression of B gene during fruit development in tomato
                                                                 The present invention provides antisense oligonucleotides with phosphorothicate backbones directed at the human E2F transcription 3 (E2F-3) coding sequences. These can be used in the therapy of dis which can be treated by modulating E2F-3 expression and to prevent infection, inflammation and tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide encoding a polypeptide having lycopene cyclase catalytic activity is useful as a probe for identifying homologous genes and for controlling gene expression in chromogenic tissues of plants.
                                                                                                                                                                                                                                                                                                                                                     transcription

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                     The invention relates to an isolated polypeptide, comprising a variant CC form of mouse or human SAC1 polypeptide. The variant form is associated CC with altered preference for carbohydrates, other sweeteners or ethanol. CC The polypeptide and its associated DNA sequence can be produced by CC recombinant techniques and is useful for preventing obesity, diabetes or CC alcoholism associated with SAC1 expression. The sequences are useful in Screening for drugs and sweeteners. Recombinant cell lines and transgenic CC embryos may be used in screening for and identifying agents that induce CC repress function of SAC1. Predisposition to diabetes, obesity or CC alcoholism can be ascertained by testing any fluid or tissue of a human cut as blood, pancreas or tongue) for sequence variations of the SAC1 (gene. A sequence variation of the SAC1 locus may indicate a CC gredisposition to diabetes, obesity and/or alcoholism and may provide a CC diagnostic mark. The polynucleotide can be detected in a biological CC sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and CC mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       applying the mixture to a polymeric separation medium having non-polar surfaces. The non-polar surfaces are free from multivalent cations (preferably chromium, iron, nickel and/or copper) and are free to bind or interfere with the polynucleotides. The method of the invention is useful for separating a mixture that contains single-stranded polynucleotides (e.g. DNA and RNA) having lengths from 5 - 200 up to 2000 - 20000 nucleotides from impurities (e.g. failure sequences, salts and/or proteins). The method of the invention allows separation to be achieved within 10 - 30 minutes, in contrast to conventional gel chromatography which can require hours or days. The present DNA sequence represents an oligonucleotide that was used in an example of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Separation of a mixture of single-stranded polynucleotides e.c. RNA, comprises applying the mixture to a polymeric separation having non-polar surfaces, and then separating the mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-NOV-2000; 2000US-00714579
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polynucleotide separation; ss; non-polar surface; multivalent cation free.
                                                                                     AAD46040 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises a method of separating a mixture which contains single-stranded polynucleotides. The method of the invention involves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 16; Page 43; 91pp; English.

The invention relates to an UDP-glucoronosyl transferase (UGT) enzyme, UGT287. The invention also relates to compositions and methods for optimising UGT287 substrate dosings and for predicting UGT287 substrate coxicity. The method is useful in determining the dose of a UGT287-glucuronidated drug that may be used in treating cancer patients. It is also useful in determining persons at risk for epirubicin toxicity, in reducing or eliminating side effects associated with epirubicin treatment, and in ways of increasing the efficacy of dosage regimens.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC recombination, of a promoter replacement fragment with a heterologous componenter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus cagent, an antifungal agent that inhibits the growth of a diploid fungus compound for identifying a therapputic agent for treatment of a mammalian compound catabolism, biosynthetic, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, curantialational, signal transduction, DNA replication and cell division cativity. The method is useful for identifying a compound having the cativity of inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to constructing (M1) a strain of diploid cells in which both alleles of a gene are modified, comprising one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele a gene and placing other allele of the gene under conditional expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-DEC-2000; 2000US-0259128P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to genes located on the X-chromosome of mammals. These genes are specifically expressed in haploid cells of the testis and encode amino acid sequences having homology with the amino acid sequence encoded by drosophila germ cell less (gcl) gene. Sequences of the invention are used for gene diagnosis, discrimination of sex, separation of sperm, infertility treatment and chromosomal manipulation, especially in livestock. They are also used in gene therapy. The present DNA sequence is a PCR primer which is used for the identification of genes by differential display method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for predicting the epidemic CC character of a Mycobacterium tuberculosis isolate and/or a selective advantage to be maintained in the host and/or the acquisition of multiple CC drug resistance (MDR) by the isolate comprising detecting an alteration (In the DNA repair system of the isolate comprising detecting an alteration of the isolate comprising detecting an alteration of the DNA repair system of the isolate. Also described: (1) detecting a CC polynucleotide; (3) a kit for detecting Mycobacterium tuberculosis; (4) an Escherichia coli strain containing the plasmid pMYC2501; and (5) CC detecting in a patient infected by Mycobacterium tuberculosis a higher CC risk of being unable to eliminate the bacillus or of developing MDR CC tuberculosis. The method is useful for predicting the epidemic character CC of Mycobacterium tuberculosis isolate and/or a selective advantage to be maintained in the host and/or the acquisition of MDR by the isolate. CC The present sequence represents a PCR primer for M. tuberculosis mutY, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for modulating the expression of transcription factor-2 gamma (TFAP2C). TPAP2C is also known as AP-2 gamma, AP-2-gamma, AP-2-2, Stra2, activating enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1. The invention is useful for inhibiting the expression of TFAP2C in cells or tissues. It is useful for treating an animal having a disease or condition associated with TFAP2C, e.g., a hyperproliferative disorder such as cancer e.g. breast cancer or colon cancer and a developmental disorder. The invention is also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense to oligonuclectide transcribed to human TFAP2C DNA. This sequence is used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to determining whether a subject has, or is at risk of developing, an abnormally low high density lipoprotein (HDL) level, involves determining the identity of the allelic variant of a polymorphic cregion of the SR-BI (scavenger receptor BI) gene of the subject, and comparing the allelic variant of the subject with allelic variants of determining whether a subject has, or is at risk of developing, a low HDL level. Also included are a kit for certaints of comparises a probe or primer which is capable of hybridising to an CC SR-BI gene, and thus identifying whether the SR-BI gene contains an CC SR-BI gene, and predicting the effect of hormone replacement therapy on the HDL level) and predicting the effect of hormone replacement therapy on the HDL level in a female subject (by identifying one or more allelic variants of the SR-BI gene which are associated with abnormally low HDL levels in females (especially postmenopausal females), thus predicting the effect of hormone replacement therapy on the HDL level in the SR-BI gene which are associated with abnormally low HDL levels and CC resulting cardiovascular discorders (e.g. coronary heart disease, consenting low HDL levels and comparence) by administering a compound that increases HDL levels, when the subject has been identified as having the common allele at residue 41 cof exon 8. The present sequence is a PCR primer used to amplify an exon coron the SR-BI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

CC junctions of genes encoding a polypeptide associated with lung and/or cc nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a cc use in antisense gene therapy. The composition is useful for treating or creventing a respiratory, lung or malignant disease or condition, also composition genetatory, lung or malignant disease or condition, also composition station in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine composition, as subject, antissue, or treating bronchocomstriction, cc lung surfactant in a subject, s tissue, or respiratory disease or condition.

CC lung surfactant in a subject, or the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO are fer wince in the manual contents of the printed of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                initiation codon, coding region, 5' and 3' intron-coon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 4809; 872pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonuclectide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding regions, or regions within 2-10 nucleotides of Junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, a CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or composition or repersonable or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC entiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of beiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO or at ferm, who inframbled not segmences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC masal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubsquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, Ote: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc junctions of genes encoding a polypeptide associated with lung and/or cc nasal airway dysfunction and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a cc use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also cc for enhancing the prophylactic or therapeutic respiratory effect of an cc anntinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing or depleting levels cc receptor, producing bronchodilation, increasing levels of ubiquinone or cc lung surfactant in a subject's tissue, or treating bronchoconstriction, cc lung inflammation, lung allergies, or a respiratory disease or condition. Cc Note: The sequence data for this patent is not represented in the printed cc aftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S

Disclosure; SEQ ID NO 5118; 872pp; English

The invention relates to a novel pharmaceutical composition, which has a composition relates to a novel pharmaceutical composition, which has a composition codon, coding region, 5' or 3' end genomic flanking regions, coding region, 5' or 3' end genomic flanking regions, coding and 3' intron-exon junctions, or regions within 2-10 nucleotides of compositions of genes encoding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or compassion and a second active agent comprising an compassion and a second active agent comprising an communication of the invention code in manufactory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a composition may have a composition are preventing a respiratory, lung or malignant disease or condition, also contininflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine code receptor, producing bronchodilation, increasing levels of bulguinone or condition. In a subject, so resulting levels of adenosine code inflammation, lung allergies, or a respiratory disease or condition. On the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from WIPO cat from wino intrombled in electronic format directly from wino intrombled in electronic format directly from wino intrombled in electroni ftp.wipo.int/pub/published\_pct\_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition.

CNote: The sequence data for this patent is not represented in the printed case of the printed specification, but was obtained in electronic format directly from WIPO case for wino liter/enh/sublanka for consecuence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallgnant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC entiinflammatory steroid in a subject, for reducing levels of adenosine CC of, or reducing sensitivity to adenosine, reducing levels of adenosine CC lung surfactant in a subject's tissue, or treating bronchoconstruction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed cat firm, who inflamed or the memores.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiatehmatic, hypotensive,
                                                                                                                                                                                                                                                                                                                                                                        Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or correspond

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Comprising origonucleotides, effective for alleviating comprising origonucleotides, respiratory tract inflammation, allergies and contractant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating conjunctation or cancer and can be anti-sense to the corresponding mRNA. The composition or cancer and can be anti-sense to the corresponding mRNA. The composition or cancer and can be anti-sense to the corresponding mRNA. The composition of the invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analyssic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypepth degradation of the target mRNA or to reduce the amount of target polypepth degradation of the target mRNA or to increase the degradation of the target mRNA or to inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
